About Skyway Software (Rel. 7/08)

Skyway Software Vision

- Eliminate the complexities of the software delivery lifecycle

Skyway Software Mission

- To enable our customers and partners reduce the cost and complexity of developing and deploying software far beyond anything they have ever experienced
- To become the number one software development and deployment platform utilized by enterprises, ISVs), and system integrators

The ineffectiveness of today's software delivery products and techniques continues to challenge IT organizations due to ongoing issues with incomplete and inaccurate requirements, late deliveries, and expensive cost overruns. Distributed software development environments oftentimes only add extra complexity and additional challenges to the existing delivery process. With Skyway Builder, however, software development Teams and business users are finally aligned via a collaborative workspace environment. And business requirements are validated visually so that solutions are delivered accurately and quickly—oftentimes at speeds 5x faster than ever before—as high-performing, SOA-compliant, standard JEE applications.

Skyway Builder and Skyway Collaborative Software Delivery

Some of the world's largest enterprises rely on model-centric Skyway Builder and its iterative, enabling methodology Skyway Collaborative Software Delivery to facilitate collaborative development and deployment of SOA-based solutions. Skyway Builder utilizes Eclipse to create an easy to use - yet distinctly flexible - modeling solution as a seamless blend of coding and modeling for building and deploying Rich Internet Applications and Web Services. These models generate standard Java code that conforms to industry best practices for deploying to the Spring Framework and Spring MVC in a web-server-only environment and/or in a full JEE container. The modeled solutions are equally portable across open-source infrastructure stacks or across diverse commercial infrastructure stacks.

Skyway Software Value Proposition and Proof of Value

Value Proposition

- **Accuracy** – prototyping applications interactively with end user customers and delivering applications that meet business needs the first time – every time
- **Productivity** – using graphical models to enable faster application delivery (versus traditional delivery methods)
- **Flexibility** – a shared workspace that enables seamless collaboration by the delivery Teams and their customers – no matter how widely distributed the Teammates may be
- **Economy** – implementing the highest quality solutions at the lowest total cost

Proof of Value

- JEE applications delivered 5x faster (with 90% fewer resources) for global energy exchange firm
- Software delivery lifecycle reduced by 37% for US agricultural retailer
- Working JEE prototypes developed in <5 days for US government agency
- Composite solutions delivered for equity trading firm in 10% of time needed to gather requirements
- Skyway Visual Perspectives used to facilitate collaborative delivery of JEE solutions using Lotus, COBOL, and Java developers located in UK, Malaysia, and South Africa
